Aquinas Hobor

School of Computing, NUS &
Yale-NUS

This talk is about...

Decidability and complexity results of
tree-like permission constraints
for concurrent programs

Permission accounting in concurrent programs

- Specify resource ownership of threads

Permission accounting in concurrent programs

- Specify resource ownership of threads
 - Example: Thread A creates lock L
 - A has **full ownership** of L.

Permission accounting in concurrent programs

- Specify resource ownership of threads
 - Example: Thread A creates lock L
 - A has **full ownership** of L.
- Assert the ownership transfer mechanism

Permission accounting in concurrent programs

- Specify resource ownership of threads
 - Example: Thread A creates lock L
 - A has **full ownership** of L.
- Assert the ownership transfer mechanism
 - Example: Thread A forks B and shares L with B
 - B should has **partial ownership** of L.

Permission reasoning in program verification

- Checking interference with fractional permissions (Boyland, SAS 2003).
- Permission accounting in separation logic (Bornat et al., POPL 2005).
- A fresh look at separation algebras and share accounting (Dockins et al., APLAS 2009).
- A Symbolic Approach to Permission Accounting for Concurrent Reasoning (Huisman & Mostowski, ISPDC 2015).
- Threads as resource for concurrency verification (Le et al., PEPM 2015).
- Viper: A Verification Infrastructure for Permission-Based Reasoning (Muller et al., VMCAI 2016).
- On Symbolic Heaps Modulo Permission Theories (Demri et al., FSTTCS 2017).
- Permission inference for array programs (Dohrau et al., CAV 2018).
- Logical reasoning over disjoint fractional permissions (Le et al, ESOP 2018).

Permissions for Concurrent Separation Logic

- Integers : $\{\dots, -2, -1, 0, 1, 2, \dots\}$
- Rationals: $\{0, 1/2, 1/4, \dots\}$
- Symbolic: object references

Permissions for Concurrent Separation Logic

- Integers : $\{\dots, -2, -1, 0, 1, 2, \dots\}$
- Rationals: $\{0, 1/2, 1/4, \dots\}$
- Symbolic: object references

Don't preserve the **disjointness property** of Separation Logic, which is crucial for **modular reasoning!**

Permissions for Concurrent Separation Logic

- Integers : $\{\dots, -2, -1, 0, 1, 2, \dots\}$
- Rationals: $\{0, 1/2, 1/4, \dots\}$
- Symbolic: object references
- Tree shares:

Don't preserve the **disjointness property** of Separation Logic, which is crucial for **modular reasoning!**

Previous works

- A fresh look at separation algebras and share accounting (Dockins & Hobor & Appel, APLAS 2009).
- Decision procedures over sophisticated fractional permissions (Le & Gherghina & Hobor, APLAS 2012).
- Decidability and complexity of tree shares formulas (Le & Lin & Hobor, FSTTCS 2016).
- A certified decision procedure for tree shares (Le & Nguyen & Hobor & Chin, ICFEM 2017).
- Logical reasoning over disjoint fractional permissions (Le & Hobor, ESOP 2018).

Previous works

- A fresh look at separation algebras and share accounting (Dockins & Hobor & Appel, APLAS 2009).

Decision procedures +
practical integration into Separation Logic

- Logical reasoning over disjoint fractional permissions (Le & Hobor, ESOP 2018).

This time

- Tight complexity bound for:
 - Tree share Boolean structure.
 - Tree share multiplication structure.
- Combined structure has non-elementary complexity.

This time

- Tight complexity bound for:
 - Tree share Boolean structure.
 - Tree share multiplication structure.
- Combined structure has non-elementary complexity.

Upper complexity bounds provide complete decision procedures.

Agenda

1. Introduction

2. Complexity for Boolean structure

3. Complexity for multiplication structure

4. Non-elementary bound for combined structure

5. Conclusion

---	---	---

Agenda

1. Introduction
2. Complexity for Boolean structure
3. Complexity for multiplication structure
4. Non-elementary bound for combined structure
5. Conclusion

Combined tree share structure

- Both Boolean structure $\langle \mathbb{T}, \sqcup, \sqcap, \bar{\cdot} \rangle$ and multiplication structure $\langle \mathbb{T}, \bowtie_{\tau}, \tau \bowtie \rangle$ have elementary complexity.
- In practice, we may need both, e.g. recursive programs (Le et al., ESOP 2018).
- What is the decidability and complexity of the combined structure $\langle \mathbb{T}, \sqcup, \sqcap, \bar{\cdot}, \bowtie_{\tau}, \tau \bowtie \rangle$?

Main result

(Le et al., 2016) The FO theory of combined structure $\langle \mathbb{T}, \sqcup, \sqcap, \bar{\cdot}, \bowtie_{\tau} \rangle$ is decidable.

Main result

(Le et al., 2016) The FO theory of combined structure $\langle \mathbb{T}, \sqcup, \sqcap, \bar{\cdot}, \bowtie_{\tau} \rangle$ is decidable.

Theorem 3. The FO theory of $\langle \mathbb{T}, \sqcup, \sqcap, \bar{\cdot}, \bowtie_{\tau} \rangle$ cannot be bounded by any tower exponent function $2^n, 2^{2^n}, 2^{2^{2^n}} \dots$

Main result

In other words, its FO theory
is non-elementary!

Theorem 3. The FO theory of $\langle \mathbb{T}, \sqcup, \sqcap, \bar{\cdot}, \bowtie_{\tau} \rangle$
cannot be bounded by any tower exponent
function $2^n, 2^{2^n}, 2^{2^{2^n}} \dots$

Main result

Solvers need to choose between completeness and performance

Theorem 3. The FO theory of $\langle \mathbb{T}, \sqcup, \sqcap, \bar{\cdot}, \bowtie_{\tau} \rangle$ cannot be bounded by any tower exponent function $2^n, 2^{2^n}, 2^{2^{2^n}} \dots$

Agenda

1. Introduction
2. Complexity for Boolean structure
3. Complexity for multiplication structure
4. Non-elementary bound for combined structure
5. Conclusion

Conclusion and future work

- We proved two tight complexity bounds for the FO theory of the Boolean tree share structure $\langle \mathbb{T}, \sqcup, \sqcap, \bar{\cdot} \rangle$ and of the multiplication structure $\langle \mathbb{T}, \bowtie_{\tau}, \tau \bowtie \rangle$.
- We showed that the FO theory of combined structure $\langle \mathbb{T}, \sqcup, \sqcap, \bar{\cdot}, \bowtie_{\tau} \rangle$, although decidable, has non-elementary complexity.
- Future work:
 - Investigate the full combined structure $\langle \mathbb{T}, \sqcup, \sqcap, \bar{\cdot}, \bowtie_{\tau}, \tau \bowtie \rangle$.
 - Solver for $\langle \mathbb{T}, \sqcup, \sqcap, \bar{\cdot}, \bowtie_{\tau} \rangle$ using MONA.

Thank you for your attention!

Main result

Solvers need to choose between completeness and performance

Theorem 3. The FO theory of $\langle \mathbb{T}, \sqcup, \sqcap, \bar{\cdot}, \bowtie_{\tau} \rangle$ cannot be bounded by any tower exponent function $2^n, 2^{2^n}, 2^{2^{2^n}} \dots$

Key idea

- Reduce from binary string structure with successors and prefix relation $\langle \{0, 1\}^*, S_0, S_1, \leq \rangle$

- $S_0(x) = x0$, e.g. $S_0(101) = 1010$
- $S_1(x) = x1$, e.g. $S_1(101) = 1011$
- $x \leq y$ iff x is prefix of y , e.g. $10 \leq 1001$
- FO theory is nonelementary (Stockmeyer, PhD thesis 1974)

Key idea

- Map each binary string to a unary tree share, i.e. tree share with exactly one black leaf, e.g.

$$\epsilon \mapsto \bullet$$

$$0 \mapsto \begin{array}{c} \diagup \quad \diagdown \\ \bullet \quad \circ \end{array}$$

$$1 \mapsto \begin{array}{c} \diagup \quad \diagdown \\ \circ \quad \bullet \end{array}$$

$$01 \mapsto \begin{array}{c} \diagup \quad \diagdown \\ \bullet \quad \circ \end{array} \otimes \begin{array}{c} \diagup \quad \diagdown \\ \circ \quad \bullet \end{array} = \begin{array}{c} \diagup \quad \diagdown \\ \circ \quad \bullet \quad \circ \end{array}$$

Key idea

- Map each binary string to a unary tree share, i.e. tree share with exactly one black leaf, e.g.

$$\epsilon \mapsto \bullet \qquad 0 \mapsto \begin{array}{c} \diagup \quad \diagdown \\ \bullet \quad \circ \end{array} \qquad 1 \mapsto \begin{array}{c} \diagup \quad \diagdown \\ \circ \quad \bullet \end{array}$$

$$01 \mapsto \begin{array}{c} \diagup \quad \diagdown \\ \bullet \quad \circ \end{array} \boxtimes \begin{array}{c} \diagup \quad \diagdown \\ \circ \quad \bullet \end{array} = \begin{array}{c} \diagup \quad \diagdown \\ \circ \quad \bullet \quad \circ \end{array}$$

- The predicate isUnary can be expressed using Boolean and multiplication operators:

$$\text{isUnary}(\tau) \stackrel{\text{def}}{=} \tau \neq \circ \wedge \forall \tau'. \tau' \boxtimes \begin{array}{c} \diagup \quad \diagdown \\ \bullet \quad \circ \end{array} \sqsubset \tau \Leftrightarrow \tau' \boxtimes \begin{array}{c} \diagup \quad \diagdown \\ \circ \quad \bullet \end{array} \sqsubset \tau$$

where

$$\tau_1 \sqsubset \tau_2 \stackrel{\text{def}}{=} \tau_1 \sqcup \tau_2 = \tau_2 \wedge \tau_1 \neq \tau_2$$

Key idea

- One can transform a FO formula from string structure into tree structure, which justifies the lower bound.

Key idea

- One can transform a FO formula from string structure into tree structure, which justifies the lower bound.

- Example:

$$\forall x \exists y. x \leq y \vee S_1(x) = y$$

is equivalent to

$$\forall x \in \text{isUnary}, \exists y \in \text{isUnary}. x \sqcup y = x \vee x \bowtie \begin{array}{c} \diagup \quad \diagdown \\ \circ \quad \bullet \end{array} = y$$
